The electronic seed monitor system consists of a console with non-volatile memory which is mounted in the tractor, seed tubes with computerized sensors, and a planting harness to which the individual seed tube sensors connect.

Seed flow for up to 36 rows, in two 18 row sections (left/right) may be monitored with one monitor.

The monitor system is powered by the tractor battery (requires 12 volts DC). The console receives information from each of the sensors and translates this information.

The single backlit Liquid Crystal Display (LCD) shows the active section, the number of monitored rows per section, the relative seed rate for each row (using a bar graph display) and scrolls various alarm and warning messages when a condition exists. A continuous audio alarm will sound upon system malfunction or underflow conditions for any monitored row. Alarms must be acknowledged by the user. Various warnings may sound the buzzer or flash one or more icons.

The monitor will power down if no activity is sensed for more than one hour. No activity means there has been no new seed flow and no operator push key input.
MONITOR KEY FUNCTIONS
Each key press is acknowledged by the monitor with a short beep.

- **OK**
  Ends and saves the new setup during installation. Acknowledges and silences alarms in the operation mode.

- **SELECT**
  Selects the application mode (left/right) at the beginning of installation setup.
  Selects the active section(s) (left/right) in the normal mode.
  Does not have an effect on a system that is configured to monitor only one section.

- **VOLUME**
  Pressing the key will turn the beeper on.
  Holding the key for periods of 2 seconds increases the volume until it reaches the maximum, at which time it rolls over to the minimum level.

- **ON / OFF**
  Powers the unit on and off.

LCD FUNCTIONS
The monitor collects data on the planting rates from all active rows and calculates an average. This average will determine the 100% mark. Seed rate for each row is then compared to the average value and the result is displayed on the bar graph.

In the example below, rows 4 & 12 are indicating that they are planting 10% higher than average, whereas rows 8 and 16 indicate 10% less than the average being planted.

The information regarding each section is displayed alternately every 5 seconds. For simple applications, where only one section is programmed, the display will automatically lock on that section. Pressing **OK** key will have no affect.

NOTE: When alternating between two sections, the display will lock on the section containing the first recognized alarm until the alarm is acknowledged by pressing the **OK** key or the alarm condition is removed.

SELECTING SECTIONS
Press **SELECT** key once to show one section. The flashing icon shows the section that is not selected. The selected section is continuously displayed on the LCD.

Press **SELECT** key again to activate both sections. Ex: Press **SELECT** key second time. The information regarding each section will display alternately every 5 seconds. For simple applications, where only one section is programmed, the display will automatically lock on that section. Pressing **SELECT** key will have no affect.

CHANGING THE AUDIO VOLUME
Press and hold down the **VOLUME** key.

The **SETUP** and **VOLUME** icons will turn on and the beeper will sound continuously. The intensity of the sound will change every 2 seconds. After the maximum volume is reached, the next change will set the volume to a minimum and will continue to get louder every 2 seconds. When the desired volume is reached, release the key.
SYSTEM ALARMS

A system alarm is entered when the monitor detects a faulty sensor or one of several other communication faults.

The corresponding row number starts flashing and the beeper sounds. All segments on the corresponding bar graph are turned off. Pushing the OK key to acknowledge the alarm will turn the beeper off. The row number will continue to flash until the alarm condition is removed. If the monitor detects a faulty sensor and there is no planting activity present, the monitor will scroll “CHECK CONNECTION.”

UNDER FLOW ALARMS

If the seed rate for one or more rows is less than 55% of the calculated average, the corresponding 60% segment will stay on, the corresponding row number starts flashing and the alarm sounds. Pushing the OK key to acknowledge the alarm will turn the alarm off. The 60% segment of the bar graph remains on and the row number continues to flash until the alarm condition is corrected.

NOTE: All alarms present within a short time before planting stops, are frozen on the screen and the text LOW or FAIL will display on the LCD. If the underflow is between 0%-10%, this warrants a FAIL condition. If the underflow is between 10%-55%, a LOW condition is generated. If multiple rows have an underflow condition, FAIL will display if any one or more rows is between 0%-10%. This allows the user to identify and fix the problem rows.

NOTE: This warning will not trigger unless a minimum time of continuous planting has passed.

NOTE: If all the rows show a seed rate of zero, the condition will not generate an alarm. It will be assumed the planter has stopped. The row numbers and the bottom 60% segment will remain on for all selected rows.

MULTIPLE ALARMS

If more than one alarm condition occurs at the same time, pushing the OK key will acknowledge all alarms that are currently displayed. For example, if one row on the left and one row on the right are alarming; pushing the OK key will only acknowledge one of them. However, if there are two alarms on the left, both alarms would be acknowledged with one push of the OK key.

SECTION NOT SELECTED WARNING

If the monitor was programmed for two sections and only one is currently selected for the display (by pressing the SELECT key), the icon of the disabled section will flash for a period of 1 minute, then turn off at each power up. If seed flow is sensed in the disabled section, the icon for that section (left or right) will begin to flash.

SEED PLANTING STOPPED

When the monitor detects no seed flow on all rows, the monitor will emit 3 short beeps to alert the user. This warning will occur each time the planter is stopped, each time the planter is raised at the end of a row or if the mechanical drive fails while planting.

NOTE: This warning will not trigger unless a minimum time of continuous planting has passed.

LOW BATTERY WARNING

The monitor is constantly monitoring its input voltage to quickly detect low power conditions. If the monitor detects that the input voltage has dropped below 10.5V, it will display LOW POWER on the LCD, provided that the monitor does not detect planting.

NOTE: After the alarms have been acknowledged and if the alarm condition is still present, the LCD will continue to display the alarm condition.
NOTE: The following steps only apply to systems that were not preprogrammed at the factory.

1. ALL the seed tubes with sensors must be disconnected from the harness and the monitor must be off.

2. Press the ON key. The monitor automatically enters the setup procedure. If the monitor was accidentally powered on with no sensors attached, the user can turn the monitor off at this point and the previous configuration is not lost.

3. Press the SELECT key. Each time you press the SELECT key the mode will toggle between left/right. The selected display will be solid and the configuration not currently selected will be flashing.

4. Press and hold the OK key to confirm the selection and continue holding until the row numbers appear on the display. During confirmation, the display will alternate between NEW and SYS to alert the user that the previous configuration will be lost. With the left/right mode selected, the monitor automatically starts with the left section. The LEFT icon shows solid and the RIGHT icon starts to flash.

REPLACING A FAULTY SENSOR
To replace a faulty sensor:

- Turn the monitor off
- Disconnect the faulty sensor
- Turn the monitor back on
- Plug in the replacement sensor.

The monitor will chirp twice to acknowledge the new sensor was learned and saved.

To replace more than one faulty sensor, proceed as stated above beginning with the lowest numbered row in the left section and continue to replace sensors in increasing order. Then move on to the right section and continue in increasing row number order.

NOTE: If the monitor is not turned off and then on, the replacement sensor(s) will be ignored until the next power on, at which point they will be randomly learned by the monitor.

FIELD OPERATION
Press the ON/OFF key to turn the monitor on & off
Information regarding each section is displayed alternately every 5 seconds.

LEFT / RIGHT CONFIGURATION
Press the SELECT key once to show LEFT section only.
Press the SELECT key a second time to show RIGHT section only
Press the SELECT key a third time to return to each section being displayed alternately every 5 seconds.

NOTE: SELECT key has no function when only a single section is being used.

VOLUME
Press the VOLUME key to increase or decrease volume. See “Changing the Audio Volume”

OK
Press the OK key to silence alarms. See “Warnings and Alarms”

Follow steps 5 thru 7 to install the second section. If no seed tubes are installed on the second section, press and hold the OK key until the word DONE shows on the screen followed by a long beep and the SAVE? icon turns off.

NOTE: Individual seed tubes may be unplugged for special situations. An alarm will sound which can be silenced by touching the OK key. The monitor will recognize the seed tube(s) when reconnected.
PROBLEM: Single Sensor communication alarm comes on (alarm on with no bar graph and a blinking row number on a single row). Faulty seed tube sensor. - Replace Sensor.

Break in the harness just before the seed tube sensor. - Inspect for break in harness and repair. If break can’t be found, replace harness section.

The connector is dirty or corroded. - Clean connector.

PROBLEM: Sensor communication alarms come on for all sensors (alarm on with no bar graphs and blinking row numbers on all rows.)

The monitor is faulty. - Replace monitor

Break in the harness just after the monitor. - Inspect for break in harness and repair. If the break can’t be found, replace harness section.

Connector is dirty or corroded. - Clean connector.

PROBLEM: Sensor communication alarms come on for some sensors (alarm on with no bar graphs and blinking row numbers on all rows.)

Break in the harness. - Inspect for break in harness and repair. If break can’t be found, replace harness section corresponding with the alarming sensors.

Connector is dirty or corroded. - Clean connector.

PROBLEM: The alarm "Under planting" or "no planting" sounds on a single sensor while planting. (Alarm on with a single bar graph segment on and a blinking row number on a single row.)

Seed tube sensor is blocked. - Clean sensor.

Faulty seed tube sensor. - Replace sensor.

PROBLEM: Seed tube sensor dirty or blocked warning comes on (after calibration, bar graph keeps blinking for a single row.)

Seed tube is dirty. - Clean sensor.

Faulty seed tube sensor. - Replace sensor.

PROBLEM: LED on the seed tube sensor will not come on.

Faulty seed tube sensor. - Replace sensor.

Connector is dirty or corroded. - Clean connector.

Break in the harness just before the sensor. - Repair harness.

PROBLEM: System low error message Pinched wire on harness. - Repair or replace harness.

PROBLEM: COP error message appears Internal console error. - Press OK. If this doesn’t help, reprogram the monitor. If still malfunctioning, send in for service.

PROBLEM: Monitor not reading population. Radar is possibly not working. - Turn console on and unplug radar wire. Look for radar on error message. If faulty replace radar.

TROUBLESHOOTING

The words WAIT CALIBRATION will scroll across the display. This simply means that the monitor is running a check of all the sensors. The red light on the back of each sensor will be illuminated while this check is taking place. After the monitor completes this “check”, it will go to the field operation mode, as shown to the right.

NOTE: Each time the monitor is powered up, the words WAIT CALIBRATION will scroll across the display. This indicates that the console is running a check of all the sensors. After several seconds, the check will be completed and if all sensors are functional the display will show the field operation mode.
